

Solana Token-2022 Standard

\$KIBBLE

An Autonomous Protocol Converting Trading Volume into Direct Support for Shelter Animals

\$KIBBLE is a purpose-driven Web3 protocol built on the Solana blockchain that bridges decentralized financial activity directly with verifiable animal welfare. The system does not penalize market trading volume; rather, it captures a defined portion of this volume on-chain and autonomously routes it to animal shelters.

01. Market Gap and Protocol Solution

Lack of Tangible Utility in the Web3 Ecosystem

While trillions of dollars in transfer volume occur across the existing Web3 ecosystem, this activity exhausts itself without leaving any tangible impact on the physical world. Rather than leaving charitable donations to the goodwill of centralized institutions or individuals, \$KIBBLE bridges this gap by constructing an automated, human-free pipeline built directly into the native transfer mechanism.

02. Value Proposition and Stakeholder Dynamics

- **Short-Term Traders:** The 2% fee applied to every transfer establishes a natural friction for high-frequency trading. The protocol effectively filters short-term speculative pressure through this mechanism.
- **Long-Term Supporters:** The protocol architecture is fundamentally designed to protect and reward long-term holders. The transfer fees generated by frequent trading continuously expand the project's real-world impact and community credibility.
- **Community and Animal Welfare Advocates:** Without requiring unverified expense reports or founder declarations, supporters verify food supplies and clinical aid directly on the public ledger via Solana Explorer transaction signatures (tx hash).

Core Principle: \$KIBBLE is not a temporary donation campaign. It is a self-sustaining, autonomous protocol powered by Solana's Token-2022 architecture that derives support from ongoing transaction flow.

03. Token Distribution and Launch Structure

The project adopts a transparent framework that completely eliminates internal selling pressure, developer dumping, and VC manipulation:

PARAMETER	VALUE	DESCRIPTION
Total Supply	10,000,000 \$KIBBLE	The protocol's initial and strictly definitive token supply.
Mint Authority	Revoked	New token minting is permanently disabled; no additional supply can be created.
Freeze Authority	Revoked	The protocol possesses no authority to freeze or blacklist wallet balances.
Liquidity Allocation	100% LP	The entire supply is locked into the liquidity pool from day one; rug-pull risk is eliminated.
Transfer Fee	2.0%	Enforced directly at the network level via the Token-2022 Transfer Fee extension.
Presale / VC Allocation	0.0%	No hidden allocations, team shares, or early investor discounts.

Token-2022 Transfer Fee Security

Fees are collected securely at the Solana validator layer without requiring external, high-risk router contracts. This architecture makes it impossible for third parties to manipulate, divert, or exploit the transfer fee.

Philosophical Purpose: The 2% transfer fee is structured not to encourage short-term speculation; it is designed to anchor authentic community members who believe in the long-term mission of the ecosystem.

04. Weekly Automated Fee Harvest and Distribution Mechanism

Through the native extensions of the Token-2022 standard, the 2% fee from every transfer accumulates securely within wallet token accounts. The execution requires zero manual signatures or human discretion:

Weekly Autonomous Cycle (Every Sunday UTC 17:00)

- **Automated Claim:** Accumulated transfer fees across all network accounts are gathered into the protocol pool by an autonomous execution bot.
- **50% Kibble Reserve:** Half of the collected volume is reserved directly as \$KIBBLE tokens into a secure reserve wallet governed by developer and community consensus.
- **50% Donation Reserve:** The remaining half is automatically converted into SOL via the liquidity pool and routed directly to the designated shelter wallet.

05. Direct Donation with Zero Intervention

SOL swapped for the donation reserve is transferred immediately to the shelter wallet without holding periods or manual approvals:

Unsigned, Non-Custodial Direct Settlement

The exact second the conversion finishes, the entire SOL balance is routed autonomously to the official shelter wallet address configured in the protocol. Neither the founder nor any community member can halt, delay, or arbitrarily alter this settlement address.

- ✓ Funds are routed exclusively to verified shelter addresses that accept direct cryptocurrency donations.
- ✓ Every transaction is instantly published to the open ledger with a transparent Solana transaction signature (tx hash).

Radical Transparency: Because the human variable is removed, fund safety is guaranteed entirely by protocol code; the Kibble reserve retains its integrity while charitable support flows autonomously.

06. Strict Immutability and Governance Scope

Routine weekly donations are never subjected to voting; the automated pipeline executes uninterrupted. However, if core protocol parameters require modification, the sole decision-maker is the community:

When Is a Public Vote Initiated?

- When replacing an existing partner shelter or onboarding an additional shelter address.
- When proposing the utilization of ecosystem reserve funds held in \$KIBBLE.
- Governance proposals require a **51% Majority Consensus** to take effect; no entity holds unilateral override authority.

07. Anti-Whale Quadratic Voting

To prevent large capital holders from monopolizing governance outcomes, voting power is calculated using a sub-linear square-root formula:

- **Governance Participation Threshold:** A wallet must hold at least **100 \$KIBBLE**.
- **Weight Formula:** Voting Power = $\sqrt{(\text{Tokens Held})} / 10$

$$\text{Voting Power} = \sqrt{(x)} / 10$$

WALLET BALANCE (X)	FORMULA APPLICATION	FINAL VOTING POWER	RELATIVE POWER SCALING
100 \$KIBBLE	$\sqrt{(100)} / 10 = 1$	1.00 Vote	Base Unit (1x)
100,000 \$KIBBLE	$\sqrt{(100,000)} / 10 = 31.62$	31.62 Votes	1000x Balance → 31.62x Power

08. Legal Disclaimer & Risk Notice

\$KIBBLE is a decentralized community and utility token developed on the Solana blockchain. \$KIBBLE does not represent equity, shares, bonds, securities, investment contracts, or promises of dividends or capital profit. The sole objective of the protocol is not dividend distribution, but rather facilitating autonomous micro-donations dedicated to animal welfare. Cryptocurrency markets carry inherent risks of high volatility and capital loss; participants interact with the protocol strictly at their own discretion.
